

Ballast photovoltaic support concept

Overview

Ballasted solar foundations are non-penetrating structural systems that resist wind uplift, sliding, and overturning exclusively through dead weight — no soil anchoring, no ground penetration, no concrete curing, no pile driving. Although solar photovoltaic (PV) system costs have declined, capital cost remains a barrier to widespread adoption. This is not. Our photovoltaic ballasts have revolutionized the field of photovoltaic panel structures, and for more than a decade they have been the reference solution for all photovoltaic systems on flat roofs. Do-it-yourself (DIY) system designs can decrease costs by about 50% by reducing labor costs, but if not attached to a building structure demand ground penetration for conventional. The Polish manufacturer said its new product is designed for fast, non-penetrative deployment. It combines corrosion-resistant materials and simplified assembly to support efficient, scalable rooftop solar installations in commercial and industrial projects. Polish mounting system provider Baks has.
