

Low Power IoT Batteries

Overview

When a Particle cellular device actively sends data to the cloud, it typically consumes 66.3 mA. Since that value—66.3 mA—doesn't mean much to most people, let's put it into perspective. According to this bl. Continuing with the previous example wherein the Particle B SoM is estimated to last ~40 hours, let's tweak our assumptions a bit. Imagine we discovered that this IoT device only need. The term "mobile assets" refers to devices, machines, vehicles, or equipment that move around based on user behavior. These devices need to be reliably connected to the. Here, "remote fixed assets" refer to stationary IoT devices that don't have access to the electric grid. RFAs also require a built-in energy supply, but since they're stationary. "Critical assets" refers to IoT devices that are tied to the electric grid but required to operate even—or especially—when the electric grid has an outage. For critical assets, adding a.
