

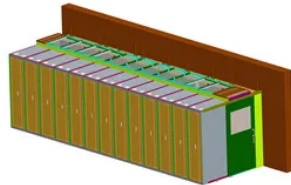

Photovoltaic bracket pull-out test

Overview

Stress tensile tests (pull-out tests) verify the stability and load-bearing capacity of the solar panel roots, which is crucial for wind and weather resistance. Customized field campaigns tailored to soil characteristics: Our field campaigns are specifically designed to match the unique. Over the past 10 years, GMS Internacional has specialised in carrying out surveys for photovoltaic plants all over the world. One of the most common tests for these types of projects is the pole load test or «pull-out test». Our services include product development support, environmental stress testing, and factory audits for quality assurance. Rely on our global network of. The solar plant services include: visual inspection, performance and commissioning tests according to IEC 62446 series, monitoring, capacity testing and energy testing according to ASTM E2848/E2939, IEC 61724 series, system performance verification according to various models.
