Energy systems are dynamic and transitional because of alternative energy resources, technological innovations, demand, costs, and environmental consequences. The fossil fuels are the sources of tradi. ••Overview of the state-of-the-art in Electrical Energy Storage (EES) is p. The need for energy emerged as soon as human beings learned to cook food, although people were unknowingly benefitting from solar energy to protect their bodies from cold. The types and uses of energy had been dynamically changing in history because Beltran (2018) regarded energy as a living, evolving, and reactive system, which remained an inte. The energy consumption has increased tremendously after the industrial revolutions due to an increase in population, invention of new techniques and machines, economic development, ac. The demand of energy does not remain uniform in 24 h in a day and the entire year, rather it drastically varies within a day and during various seasons of the year. Thus, peak and off-pea.
